

Atypical Location of Pleomorphic Adenoma Involving the Eyelid Margin

A 34-year-old man presented with a lesion that progressively enlarged for 5 years. Examination revealed a reddish right upper eyelid margin mass that was tender to palpation (A, B). Visual acuity was 20/25 in both eyes, and the temporal visual field was limited on the right. Excisional biopsy was performed, and histopathology revealed ribbons of epithelial cells and adipose tissue amidst a background of myxoid stromal tissue consistent with pleomorphic adenoma (C, D). Pleomorphic adenomas commonly present at the lacrimal and salivary glands, but are very rare in the periocular region, especially on the eyelid margin. (Magnified version of Figure A-D is available online at www.aaojournal.org).
