

Pseudonictitating Membrane

A 69-year-old man presented with a membrane over the bulbar conjunctiva in his right eye (OD), encroaching cornea from the temporal side, and freely movable over the conjunctival and corneal surface (A). Extraocular movements were free. The patient had no history of pain, foreign body sensation, lacrimation, chronic illness, prior hospitalization, trauma, adverse drug reaction, or chemical injury. The Schirmer's test showed normal tear film production. The patient had cataracts in both eyes, otherwise, anterior segment and fundus findings were normal. Uncorrected visual acuity was 6/36 OD and 6/18 in the left eye (OS). Intraocular pressure was 16 mmHg OD and 15 mmHg OS, respectively. Image of OD with membrane in (B) primary gaze, (C) down and out position, and (D) up and inwards (Magnified version of Figure A-D is available online at www.aaojournal.org).
