Pictures & Perspectives

Intrapapillary Hemorrhage and Optic Disc Drusen

A 43-year-old woman with hypertension and obstructive sleep apnea complained of a shadow in the vision of the right eye. One week prior she fell forward into a wall. Visual acuity was 20/20 in both eyes. There was bilateral optic disc drusen and hemorrhage within the right optic disc (A). Fluorescein angiogram and OCT were normal. Six weeks later the intrapapillary hemorrhage resolved (B). Optic disc drusen can be complicated by intrapapillary, peripapillary (retinal or subretinal), or vitreous hemorrhages. The etiology of these hemorrhages is not clear, but is suspected to be caused by vascular obstruction, Bruch's membrane rupture, or vitreopapillary traction. (Magnified version of Figure A–B is available online at www.aaojournal.org).
