## Sarcoidosis-associated Cicatrizing Conjunctivitis

An uncommon ocular manifestation of sarcoidosis caused bilateral progressive cicatrizing conjunctivitis (CC) in a 40-year-old White woman with known history of sarcoidosis. Anterior-segment imaging revealed conjunctival scarring with fornix foreshortening, symblepharon ( $\mathbf{A}$ - $\mathbf{B}$ ), and subtarsal fibrosis ( $\mathbf{C}$ ). Conjunctival biopsy yielded multiple, subepithelial, non-caseating granulomas ( $\mathbf{D}$ , arrow), and immunofluorescence was negative for immunoreactant deposition in the basement membrane. Sarcoidosis is an uncommon cause of CC and should be included in the differential diagnosis. (Magnified version of Figure  $\mathbf{A}$ - $\mathbf{D}$  is available online at www.aaojournal.org).
